

AnimalsOnFire -- Joshua Kloefer, Yaying Liang Li, Qina Liu, Thomas Yu

SoftDev

P01 -- Design Doc

2021-12-09

Components

- Collectible: image of animals you can receive when you answer trivia questions right
- Trivia questions: questions testing user on facts
- Burning: image on fire
- Login accounts: users must need account to keep collectibles
- Collection: all the collectibles, items, special collectibles, achievements that the account has; essentially like user's profile
- Random Picker: mechanism by which a random collectible is given to user; basically like a gumball machine; duplicates not allowed
- Achievements: when user gets a certain item or a certain amount of collectibles (or an other assortment of tasks), user gets items or special collectible
 - Achievement page: shows all possible achievements you can get, ones that user have gotten are highlighted
- Items: items users can use to aid in collectible collecting [Hint and Extinguisher items]
 - Some make it easier to answer questions [Hints?]
 - Fire Extinguisher: put collectible out of fire and receive collectible despite answering question wrong
- Special collectible: collectible you can only get through achievements; basically like trophies

Python:

- Will set up the database by creating the tables and adding information to each table
 - Users Table: username, password
 - Individual Tables
 - Name of the table will be the same as the username
 - Will keep track of all collectibles, items, achievements, etc
- Will interact with the APIs by making http requests
- Will send information using flask to create the webpage

Flask:

- Will create the webpages the user will interact with
 - Sends questions and the collectibles obtained by a user to be displayed
- Will create a session when a user is logged in

Sqlite3:

- Will have tables that will store information related to a user's account that can be pulled via python

Jinja2:

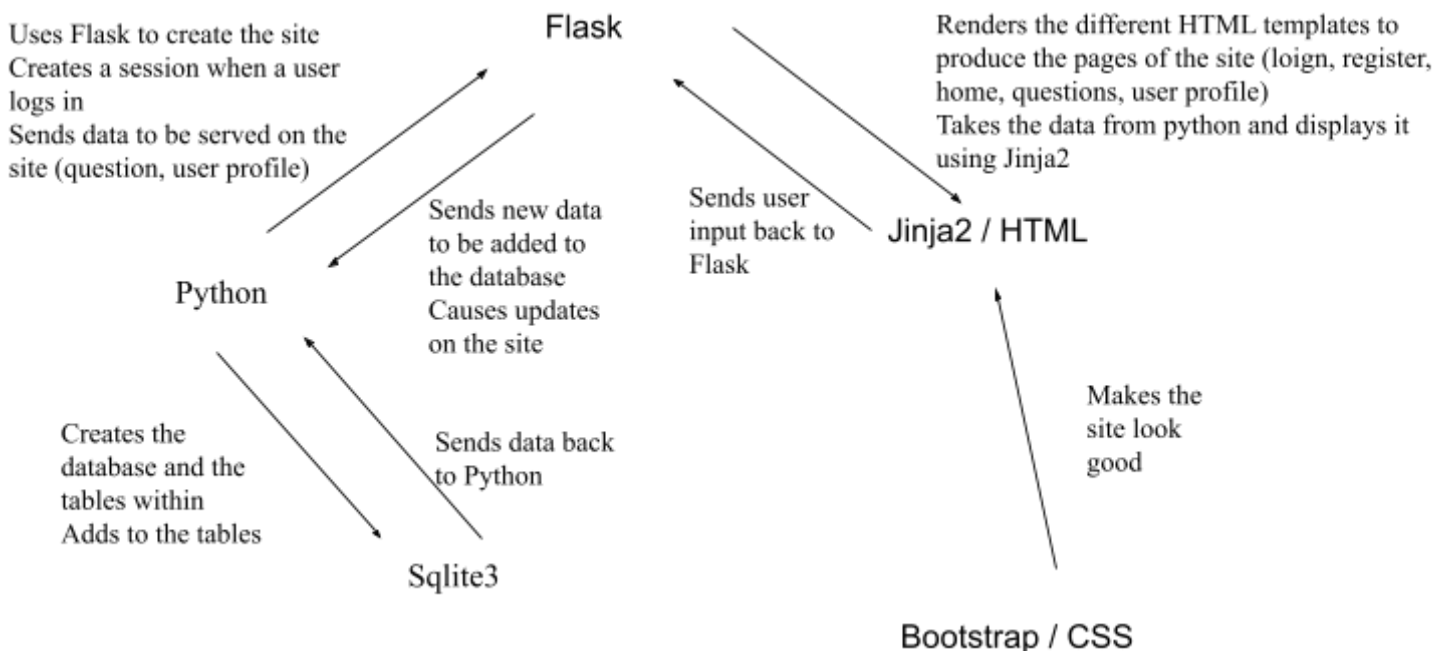

- Will be used to create the HTML templates that can display different trivia questions and the user's profile
- Also displays the collectibles' images and their burning on fire

Bootstrap:

- Will be used to setup the CSS for the site

How The Components Relate

- User answers trivia questions
 - If get it right → receive random collectible (no duplicates)
 - If get it wrong → sees collectible they would have gotten in fire
 - Collectible they get is chosen by random picker
- Account is needed for user to build collection (and thus all the things that require a collection to have, like items, achievements, special collectibles)
 - If logged in, get question right → user obtains collectible
 - If not logged in, user will see collectible (not on fire, will say that user has gotten said collectible) but will not show up in their collection
 - If not signed in, collection page will tell user to please login in order to build a collection
 - Not needed to sign in to answer questions, only needed to keep track collectibles gotten [I like that lol]
- Achievements gotten from collecting (based on collection)
 - Can result in:
 - Items that make collecting easier
 - Special collectibles
- Collection keeps track of and shows user's collectible, items, special collectibles, achievements

Database

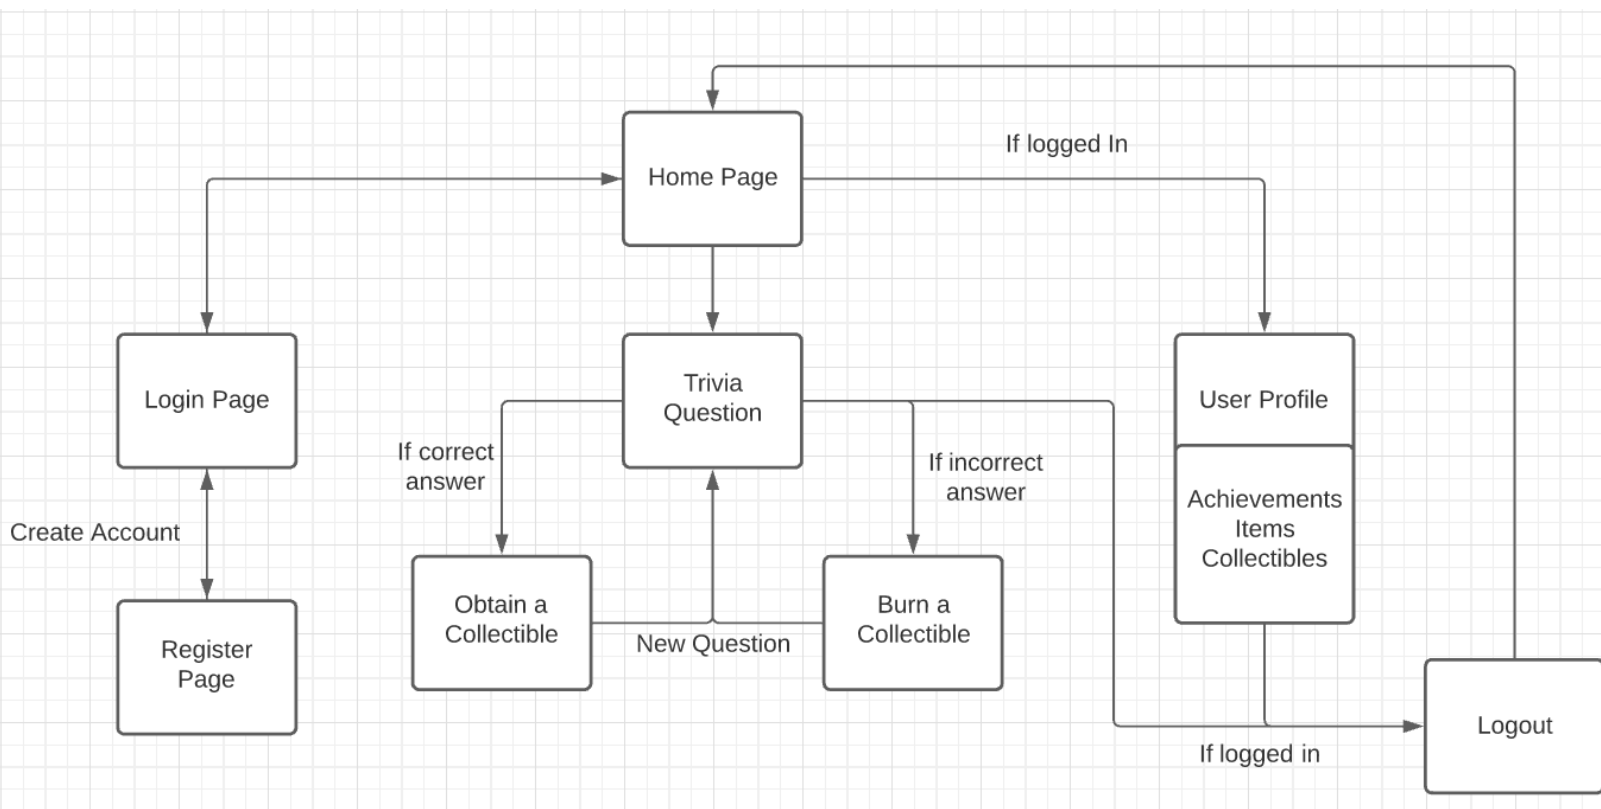

- **Users** Table: Table to track usernames and passwords of registered accounts

Username (TEXT)	Password (TEXT)
-----------------	-----------------

- **User Data** Tables: Individual tables for each user
 - Name for each table would be the username associated with it
 - Items include collectibles, items, and achievements, question id
 - Can only have the ids of the questions the user answered correctly if the API provides an id with each question (Jservice or Trivia API)
 - Number will be used primarily for items (as you can have multiple)

Type of Object (TEXT)	Object (TEXT)	Number (INT)
-----------------------	---------------	--------------

Sitemap

https://lucid.app/lucidchart/6623fcfd-1850-4195-bd06-d5f162a1d51f/edit?invitationId=inv_815d74d3-8ea0-44ad-aadb-41a884b35a9f&page=0_0#

Breakdown of Tasks

- Joshua Kloefer: (Backend) Selecting random questions as well as checking if they are correct or not, Users Table, Trivia Table
- Yaying Liang Li: (Backend) Storing collectibles as well as questions already asked, Collectibles Table, selecting which collectible to give
- Qina Liu: Frontend (How Site Looks), Collection page, burning, login + accounts
- Thomas Yu: Frontend (How Site Looks), achievements, items, special collectibles

APIs

Trivia: Could be just one or multiple

- Open Trivia (<https://opentdb.com/>)
 - Multiple choice or T/F, but no question id, has text encoding
- Jservice (<https://jservice.io/>)
 - Open ended questions, has question id
- Trivia API (<https://trivia.willfry.co.uk/>)
 - Multiple Choice questions, has id
- All APIs can:
 - Serve questions based on category
 - Serve multiple questions at once
- Will be used to request the trivia questions to serve to the user

Collectibles:

- Axolotls (<https://theaxolotlapi.netlify.app/>)
- Cats (<https://alexwohlbruck.github.io/cat-facts/docs/>)
- Dogs (<https://dog.ceo/dog-api/documentation/sub-breed>)
- Ducks (<https://random-d.uk/api>)
- Pets (<https://www.petfinder.com/developers/v2/docs/>)
- Each API will be used to obtain images that will be used as collectibles for the user to obtain

Framework:

Bootstrap

- Found it to be easier to work with compared to Foundation
- Documentation seemed easier to navigate for Bootstrap

Target Ship Date: Jan 6, 2022

- We would like the due date to be after break rather than right before break, and the day following the first day returning seems conducive for non-stressed-out good code development
- Break good time for dry run too!
